

Does the program express the intended financial condition?

Compare the archived circular, the two threshold alternatives, and the examples below. These calculations cover only the financial subcondition. A true result does not establish all SPI requirements or authorize a transaction.

Annex 1, paragraph 3.1

3.1 An SPI should have at the relevant date – (a) a portfolio of at least HK\$40 million or its equivalent in any other currency; or (b) net assets, excluding primary residence, of at least HK\$80 million or its equivalent in any other currency.

[Read the Catala explanation and code](#)

Five cases that distinguish the decisions

The portfolio is exactly HK\$40 million; net assets are zero.

The financial condition holds because equality satisfies the portfolio threshold.

The portfolio amount is unavailable; net assets are HK\$90 million.

The financial condition holds through the net-assets alternative. Portfolio evidence remains missing.

The portfolio amount is unavailable; net assets are HK\$70 million.

The decision remains unresolved: net assets do not suffice, but the portfolio could still qualify.

Both synthetic exceptions apply and both specify ten.

The RuleIR convention requires a conflict. An explicit ambiguity check in Catala preserves that convention.

The first synthetic exception applies; whether the second applies is unknown.

The result remains unresolved because the second exception could create a conflict.

Questions for a reviewer

Explain the two thresholds, including units and whether equality is sufficient. Explain why missing portfolio evidence can still yield true when net assets suffice. Identify the missing legal judgments. In the synthetic exception example, explain why two applicable exceptions require a conflict. Record errors and assistance needed when answering these questions from the RuleIR and Catala versions.

Human review has not yet been performed. This packet establishes neither readability nor a reduction in review effort.
