

BASF 2032 notes: selections and incorporated report scope

Prospectus engine development addendum

5 October 2026

The final terms dated 6 March 2023 for BASF SE's EUR 500 million 4.250% notes due 8 March 2032 (ISIN XS2595418596) contain 55 checkboxes and eight bilingual Yes/No provisions in Part I, pages 3–7. The optional engine component records all 63 choices, compared with 21 in the previous review, and links each to a source location in the controlling German Option I terms of the September 2022 base prospectus. Continuous operative terms and the complete issue dossier remain unfinished.

The distinctions among redemption provisions are consequential. The dated issuer call and make-whole call are selected, as is the clean-up call. The separate interest-date call, scheduled holder put, renminbi call and transaction-trigger call are not selected. The change-of-control holder right is selected: its rating condition and exercise procedure survive the deletion of the separate scheduled put. The clean-up clause on base-prospectus page 122 requires acquisition of at least 75% of the original principal *and* reduction of that principal in the global note. It permits redemption of the whole residual issue, with 30–60 days' notice, at par plus accrued interest.

Issuer identity also changes which branches apply. The initial guarantee for BASF Finance issues in section 2(3), pages 110–111, is excluded for this BASF SE issue. Section 10(d), page 129, nevertheless retains a guarantee condition for a later issuer substitution. Removing every guarantee reference would lose that condition. Section 11 separately addresses majority creditor amendment under the German Bond Act (SchVG).

Page 12 of the supplement dated 27 February 2023 lists the following parts of the retained English BASF Report 2022:

Incorporated item	Printed and physical pages
Auditor's report	197–202
Income statement	203
Balance sheet	205–206
Cash flows	207
Notes	209–290

The 92 listed pages match the retained report's printed pagination. The supplement's incorporation table also gives 195–209 as its broader range, which does not encompass the listed notes. Both descriptions remain recorded, so the full incorporation scope requires resolution. The auditor's report on page 197 also states that its German original is authoritative. Admission here establishes source identity and detailed page scope, with financial values and column reading order still unqualified.

Validation and remaining work. 186 focused engineering tests passed, including changed selections, bilingual conflicts, unknown options, altered source identity, forged packets, stale review and prerequisite bindings, report-page changes and a lost language qualification. They include the 123 earlier OCR and refresh tests. These exposed development cases have no independent legal labels or unseen evaluation result.

The loader reconstructs each accepted packet from the protected sources and the reviewed specification. Its successor view supplies selected/deleted facts and clause locations while retaining an unresolved dossier and no legal answer. The counts measure coverage; they do not establish legal accuracy or production readiness.

The next local task is to construct continuous German Option I terms, including nested alternatives, filled fields, cross-references and issuer-specific conditions. Earlier and interim reports, applicable agreements, amendment coverage and the report-range discrepancy also remain. Beyond BASF, the programme still needs broader bilingual extraction, general semantic repair, the other issuer dossiers, BES dependencies and precedence, jurisdiction primary sources and actual regulatory and financial facts.

Independent adjudication of the original 1,467 records (1,307 unique spans), assignment of the 25 review forms, an unexposed evaluation cohort and intended-use acceptance remain prerequisites for promotion. The executable repair loop covers this continuation; the next contract-construction phase still requires implementation.

The entry baseline protects 8,923 files. No network request was made; 24 of 212 authorised requests remain. The original engine and previous evidence are preserved. This addendum records provisional development review, with human manuscript acceptance pending.
